OAuthgithub

when we want login into some xyz.com we don't create an account in xyz. Instead we login into xyz.com using

third party applications.(Github, facebook, google)

created our project in github and provided our home page url and callback url

Once a user enters a username and password we will get a code for that user.

Using clientId,clientSecret and code we will get access token for that user

Using access token we will get user info of that user

Note: Every user will have one code & access token.

Please go through the recorded lecture for code implementation
