

Coding Challenge - Week 12 Day 2

Today was the day where we built playlists and the ability to create them. I will put the code into Github, so please refer to them and try to finish until today. Also I have included a codepen for a loading component that looks exactly like how Youtube has when we swap between pages. What I want you to do is think where that component can be placed and what classes should be removed and added based on the current loading state. Also if you could remember we had multiple loading values (playlists, auth, trending), so make sure you import all of them and check for the same.
