

Coding Challenge - Week 9/31 Day 3

As we have learned state and how to use it, Create a component called ReviewUser. It takes a props called review which is an object containing the following properties,

1. Name: string
2. Email: string
3. ProfilePicURL: string (Get it [here](#))
4. Review: string
5. Rating: number

Make it like a Card, like how you would see on a testimonials section. (Inspirations [here](#)). The App component should have the state object containing this review data. In short, pass the review state from App to ReviewUser component as a prop.
