

Assignment - Week 12 Day 4

Create a movie fetching application with React and Redux. I am going to be particularly vague because I want you to think about the architecture as well as the structure of application. Fetch the API data from [here](#). You can take [one of my toy projects](#), as a reference, and try to build as many features as possible. Bare minimum, I want the ability to search movies, filter movies, view a detail page about a movie as well as show some categories like Action, Romance, Music, TV series. Use SCSS, as it's been a while since we used it. Install the node-sass NPM package alone, and start using scss files just like you would do on css files. Good luck.
