

# Coding Challenge - Week9Day4

We are going to extend the form component of what we learned during the lecture with some validation. Install the following package from NPM. Its called [validator](#) and makes our life so easier for form validations. I am not going to complicate the challenge by asking real time validation, but check the same once the user clicks submit.

1. Name is required, minimum 3 characters at least. (I don't think anyone would have a name less than 3 characters lol, but hey that's just my opinion)
2. Password is required, min length - 8 characters.
3. Email is required as well as check for valid email or not.

Again, these all shall be checked only after user clicks submit. Alerting the error message is more than enough. If all these checks pass, then alert the user as "submission successful". Hope I made sense.
